

About Us

VOTIRO

Zero Trust

Data Detection and Response

Can you trust the data entering your organization?

More importantly, can you trust that your data is safe from threat actors looking to expose sensitive information?

Votiro is the only data security solution that ensures all files are safe from privacy risks and malware threats.

Votiro is best-in-class Zero Trust Content Security combined with real-time Data Detection and Response. Our proven data security platform is a comprehensive solution for organizations looking to remain compliant with stringent data regulations by reducing privacy risks and eliminating hidden malware.

The Best of Both Worlds - Only With Votiro

Real-time Privacy and Compliance

Votiro masks sensitive data in-motion, wherever it flows. This enables IT and SOCs to keep up with the amount of data coming in—while helping organizations remain compliant.

Votiro automatically masks data to prevent information from ending up in the wrong hands—unstructured and structured—whether maliciously or by mistake.

Other “solutions” are just reactive, including DLP, DSPM, and EDR. This means they simply alert teams of suspicious activity after the damage has been done, leaving already-strained teams with alert fatigue and manual mitigation instructions.

Proactive Threat Prevention

Votiro is a pioneer in the Content Disarm and Reconstruction (CDR) space, patenting our advanced Positive Selection® technology to automatically cleanse incoming files of hidden threats.

Votiro’s Zero Trust architecture ensures that zero day threats never reach endpoints—plugging gaps left behind by AV and sandboxing.

Full file functionality is retained by using only known (trusted) elements—leaving necessary items intact, including macros.

Votiro sanitizes 200+ file types, including PDF, ZIP, EML, and those that are Password-protected.

Votiro’s open-API seamlessly integrates with tech stacks to disarm known and unknown threats, at scale, without adding friction, interrupting workflows, or impacting file fidelity. This means threat actors can no longer infiltrate endpoints and access and abuse sensitive information like PII, PCI, and PHI—which can ruin customer trust and result in costly fines.

Take a free 30-day trial and see how Votiro stops threats and privacy risks before they ever reach your endpoints.
